Installation, Licensing, and Server Configuration

1	What are the system requirements to install Astera Centerprise?	1
2	Why do we need to make two installations for Astera Centerprise?	3
3	What's the difference between Custom and Complete installation?	5
4	What's the difference between 32-bit and 64-bit Centerprise?	7
5	Can we use a single license for multiple users?	9
6	Can we install Centerprise on more than one system using a single license key?	11
7	Does Centerprise client work when it's not connected to the server?	13
8	Why do we need to build a cluster database and set up a repository while working with Centerprise?	15
9	Which database providers does Centerprise support for setting up a cluster database?	17
10	How many Centerprise clients can be connected to a single server?	19
11	How do Centerprise client and server communicate?	21
12	Is there any limit to the number of jobs that can be run on the server at a time?	23
13	Can we access help documentation from Centerprise client?	25
14	Up to how many servers can a single Centerprise client connect to?	27
15	Why Centerprise is possibly not able to access my source file or create a new one?	29
16	Will an upgrade result in the failure of existing .dlls?	31
17	I uninstalled Centerprise from one machine and attempted to activate it on a new device, but the server is not accepting my license key. Why am I getting this error?	33
18	Will I lose all my scheduled jobs when upgrading to the latest version?	35
19	Is there a way to export the existing jobs from the previous to the latest version of Centerprise?	37

20	Is there a permanent link from where I can always have access to the newest build?	39
21	Does Astera Centerprise support data extraction from unstructured docs or text files?	41
22	What is the difference between full and incremental loading in database sources?	43
23	Does Centerprise support extraction of data residing in online sources?	45
24	How is the File System Items Source used in a dataflow?	47
25	How does the PDF Form Source differ from Report Source in Centerprise?	49
26	Does Centerprise support extraction of data from EDI files?	51
27	How does the Raw Text Filter option work in file sources in Centerprise?	53
28	What does the Aggregate Transformation do in Astera Centerprise?	55
29	How is the Aggregate Transformation different from the Expression Transformation?	57
30	What are the different sorting options in the Aggregate Transformation and how do they impact the output?	61
31	Can we omit duplicate records using the Aggregate Transformation in Astera Centerprise?	63
32	How many datasets can a single Aggregate object take input from?	65
33	What is an Expression Transformation?	67
34	How is Expression Transformation different from the Function Transformation?	69
35	Does the SQL Query source support the use of parameters? If yes, how and in what cases can it be used?	71
36	What is a set level transformation?	73
37	What is a Record level transformation?	75
38	What are the different types of lookups in Astera Centerprise?	77
39	How is the Filter Transformation different from the Route Transformation?	79
40	Is the Filter transformation similar to Data Quality Rules in function?	81
41	What are the different types of Join available in Astera Centerprise?	83
42	Can we perform a Join using more than one key in the Join transformation?	85
43	What's the difference between INSERT, UPDATE, UPSERT and DELETE actions available for data loading in a Database Table destination?	87
44	What does the Truncate Table option do in Database Table destinations?	89
45	What's the difference between ' <i>Bulk insert with batch size</i> ' and ' <i>Use single record insert</i> ' Data Load Options in Database Table destinations?	91
46	How does the Default Value column in Database Table destination layout work?	93
47	What does the Advanced Connection Info option do in a Database object?	95

48	What's the maximum number of groups we can create in Route transformation?	97
49	What is the outcome if an incoming record matches multiple rules in Route transformation?	99
50	Can we perform a hierarchical join using the Join transformation in Centerprise?	101
51	What is the meaning of Batch Size in Sequence Generator transformation where a sequence is generated in a Database Table?	103
52	Can we join multiple children to a single parent node using only one Tree Join transformation object?	105
53	Which output would be assigned if a record satisfies two conditions in a Switch transformation object?	107
54	What is the order of priority of options in different columns in the Layout Builder of the Merge transformation object?	109
55	What is the difference between Survivor Type and Precedence in Merge transformation?	111
56	Why does the Return All option on the Lookup Options screen in the File Lookup transformation give an error?	113
57	If I want to have a different field delimiter, say a pipe (" "), is there an option to export with another delimiter and filename extension?	115
58	I want to change the output format of a column, say integer to string, or vice versa. Any error trapping abilities with that conversion?	119
59	Tools Menu > Data Format has different date formats, but it doesn't seem to do anything. Each time I go into it, it still has the first option selected even after choosing a different one.	121
60	Can we export the Object Path column present in the Data Preview window?	123
61	What will be the outcome if we write files multiple times to the same Excel Destination?	125
62	Is there a log file created that we can have written/saved to a folder of our choice for troubleshooting purposes? Something that shows when it ran, how many records it loaded, how many failed, and why?	127
63	Why Database Diff Processor does not have an output node in Centerprise v8.2?	129
64	Which Database Write Strategy is more efficient for working with larger volumes of data?	131
65	In which Database Write Strategy do we use a CDC file?	133
66	How can CDC improve the performance of Database Diff Processor when used in conjunction?	135
67	Which one from the Database Diff Processor and Source Diff Processor is a more cost-effective write strategy?	137
68	Is it necessary for the database tables to be of same layout in order to work with Data Driven, Database Diff Processor, and Source Diff Processor?	139
69	Is there any limitation to the type of source each Database Write Strategy can take input from?	141
70	Why is it necessary to select the Single Port option in the Database Table Destination while working with a write strategy?	143
71	Will a record be tried against the following rule if it satisfies the current rule in Data Driven write strategy?	145

72	What is the difference between ‘Single Output’ and ‘One Port for Each Action’ in Source Diff Processor?	147
73	What is the difference between UPSERT and Database Diff Processor?	149
74	Is it sufficient to use a Slowly Changing Dimension Write Strategy to insert new records and update existing records? Or do we need to use it in conjunction with Database Diff Processor for the purpose?	151
75	How can Source Diff Processor load data incrementally?	153
76	What is a dataflow?	155
77	What is a workflow?	157
78	What does deployment refer to in Centerprise?	159
79	What is the difference between a Decision and OR object in workflows?	161
80	Is it possible to work with nested subflows in Astera Centerprise?	163
81	What is the difference between Single Instance Data Region and Collection Data Region in Astera ReportMiner?	165
82	How can we preview ‘x’ number of records in a Data Preview window?	167
83	Does the Max result rows option in <i>Tools > Options > Query tab</i> being defaulted at 5000 limit the processing of any records?	169
84	What is Pushdown Mode?	171

CHAPTER 1

What are the system requirements to install Astera Centerprise?

The following system requirements should be met before installing Astera Centerprise:

CHAPTER 2

Why do we need to make two installations for Astera Centerprise?

Astera Centerprise has a client-server architecture. Centerprise's client is a designer studio where flows and job tasks are designed whereas the server is an execution platform for jobs and flows designed on the client. This is why we need to make two installations for Astera Centerprise – for client and server, separately.

Read more on Centerprise installation in [this](#) document.

What's the difference between Custom and Complete installation?

In custom installation, we can choose which features we want to install and which we don't depending on our requirement. Whereas in a complete installation, the whole application is installed without any modifications.

What's the difference between 32-bit and 64-bit Centerprise?

The 32-bit Centerprise is compatible with 32-bit operating system and the 64-bit Centerprise is compatible with 64-bit operating system.

Can we use a single license for multiple users?

Yes, every license has a specified number of users assigned to it, and the limit depends on the license you have purchased.

Can we install Centerprise on more than one system using a single license key?

Yes, you can install Centerprise client on more than one machine and connect it to the same server using the same license key. However, more than one server cannot be licensed with the same key.

CHAPTER 7

Does Centerprise client work when it's not connected to the server?

No, for Centerprise to work, it has to be connected to a server.

Why do we need to build a cluster database and set up a repository while working with Centerprise?

We need to build a cluster database and set up a repository to communicate with the server and to store information about jobs scheduled and executed on the server. To view the jobs deployed on the server, go to *Server > Job Monitor****.

Start Page Dataflow1.Df Dataflow2.Df Dataflow3.Df Dataflow4.Df Scheduler - DEFAULT Job Monitor

CHAPTER 9

Which database providers does Centerprise support for setting up a cluster database?

Centerprise supports SQL server and PostgreSQL for setting up a cluster database.

CHAPTER 10

How many Centerprise clients can be connected to a single server?

In the current implementation, there is no restriction on the number of Centerprise clients that can be connected to a single server.

How do Centerprise client and server communicate?

Client and server in Astera Centerprise communicate on REST architecture. REST-compliant systems, often called RESTful systems, are characterized by statelessness and separate concerns of client and server which means that the implementation of both can be done independent of each other, if each side knows what format of messages to send to the other.

The record of communication between Centerprise client and server is stored in a repository. Before you start using on Centerprise, a repository must be set up to store the records of deployed jobs. Currently Centerprise supports SQL server and PostgreSQL for building cluster databases, which can then be used for maintaining the repository. It is where information about job logs, job queues, and job schedules are saved.

CHAPTER 12

Is there any limit to the number of jobs that can be run on the server at a time?

Yes, the limit on the number of concurrent jobs on a server depends on the license you have purchased.

Can we access help documentation from Centerprise client?

Yes, there are three ways to access help documentation from Centerprise client:

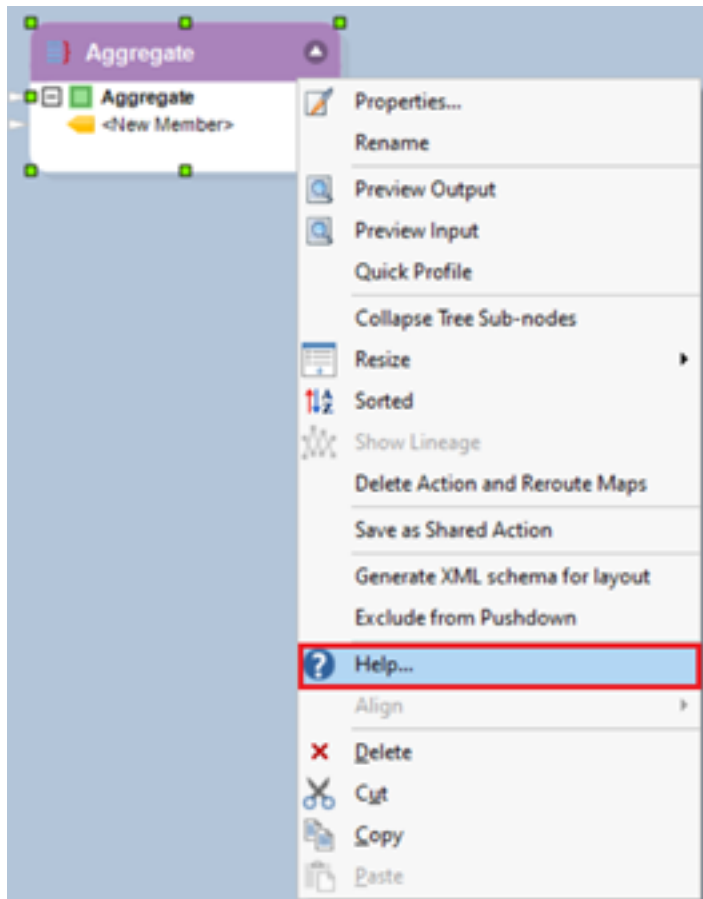

1. From the *Help* menu in the main *Menu Bar*.

1. From the question mark icon present in the *Icon Bar*.

2. By right clicking on any object and selecting the *Help* option from the *context menu*.

Up to how many servers can a single Centerprise client connect to?

A single Centerprise client can connect to only one server at a time. However, it can be configured to multiple server servers.

Why Centerprise is possibly not able to access my source file or create a new one?

One of the possible reasons for this could be that the Centerprise Server does not have access to the directory where you are trying to export your file or import it from.

While working with Centerprise, you must be connected to the server to execute any jobs. Centerprise client is only used to design and submit jobs to run on the server. If the server is located on another machine, it needs to have access to your files. This requires you to have a shared folder accessible by both client and server machines.

You can also access files from your local directory if the server is installed on the same machine as the client.

CHAPTER 16

Will an upgrade result in the failure of existing .dlls?

No, upgrading from Centerprise 7 to 8 or from Centerprise 8.x to 8.x would not result in the failure of any existing .dlls, and they will continue to work as before.

CHAPTER 17

I uninstalled Centerprise from one machine and attempted to activate it on a new device, but the server is not accepting my license key. Why am I getting this error?

You might get this error when the license key has not been correctly deactivated from your previous machine.

CHAPTER 18

Will I lose all my scheduled jobs when upgrading to the latest version?

Version 7 and 8 are different applications. You can have both installed on your machine and run them side by side. When installing the version 8 client and server, you will need to build a new cluster and connect to the Centerprise 8 server. You will still be able to use version 7, so nothing will be overwritten. Also, all your models and flows created in Centerprise v7 will work in v8.

Is there a way to export the existing jobs from the previous to the latest version of Centerprise?

There are three ways in which you can export the existing jobs to the latest version of Centerprise:

1. Direct export and import of schedules from Scheduler.
2. Upgrading the 7.6 repository to 8.x. This is a required step if you previously had 7.6 installed. This option preserves any existing schedules. To know more about it, refer to this [article](#).
3. Upgrading 8.x to 8.3/8.4. This is a minor repository upgrade, and it adds some optimizations (indexes). This option also preserves any scheduled jobs.

CHAPTER 20

Is there a permanent link from where I can always have access to the newest build?

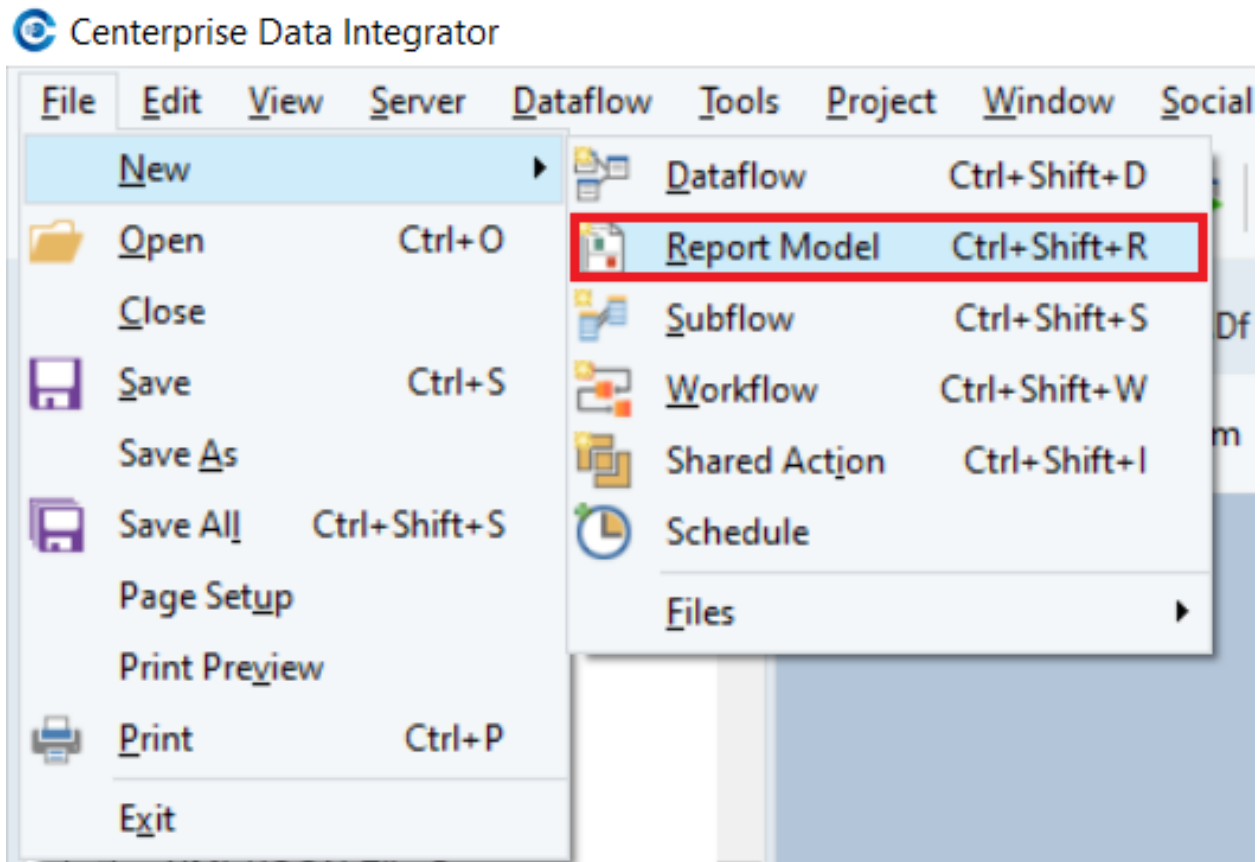

Yes, you can always download the latest build for client and server from the following link:

<http://www.astera.com/download-center/>.

Does Astera Centerprise support data extraction from unstructured docs or text files?

Yes, Astera Centerprise supports data extraction from unstructured docs and text file formats such as text, Excel, PRN, and PDF files through ReportMiner.

To open a Report Model, go to **Menu Bar** and select *File > New > Report Model*.

Click [here](#) for more information on creating a Report Model in Astera Centerprise.

What is the difference between full and incremental loading in database sources?

During a full load, the entire data is processed on each run whereas during an incremental load, an *Audit Field*, is specified on the basis of which, the Database source reads the incremented data only. The Incremental and full load options can be found in properties of Database source object. For more information on full and incremental loading options, click [here](#).

Orders : Pick Source Table and Reading Option

Editing: Orders

☐ Favor Centerprise Layout
(In case of discrepancies between this layout and what is in DB, go with Centerprise data types)

Dynamic Layout

☐ Dynamic Layout

☒ Delete Fields In Subsequent Objects

☒ Add Fields In Subsequent Objects

Incremental Read Options

Read Strategy

☐ Full Load

☒ Incremental Load Based On Audit Fields
(Read based on value of audit fields such as created date, last update date, etc.)

☐ Perform full load on next run

Audit Field: OrderDate

Select the field containing timestamp, last update date, or auto number

Incremental Transfer Information File Path (Centerprise will store information related to last run in this file. Click reset if you want the next run to read the entire dataset)

File Path: d:\new_orders.cdc

Reset

Prev Next OK Cancel

Does Centerprise support extraction of data residing in online sources?

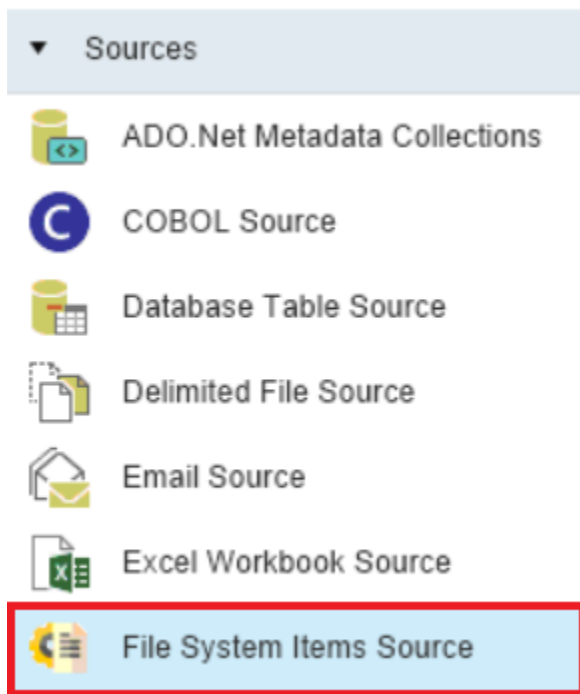

Yes, Centerprise supports the extraction of data residing in online resources. There are various built-in features such as **File Transfer Protocol (FTP)** which enables users to access files from a remote directory, [Email source](#) through which we can extract file attachments from emails, **Electronic Data Interchange (EDI)** which enables users to save time and resources with its orchestration capability and **REST API Browser** which is used for sourcing data from an API.

How is the File System Items Source used in a dataflow?

A *File System Items Source* is used to point towards a folder or directory containing multiple files that are to be processed in a flow. In a dataflow, it is used when we use a source as a transformations to provide a dynamic file path to a source object. It can be either run in singleton mode or in a loop. It requires a file path to the directory where the source files reside. It also provides an option for including items in subdirectory which, if checked, will include all the files present in the sub-folders

To learn more about how the *File System Items Source* works in using sources as transformations, click [here](#).

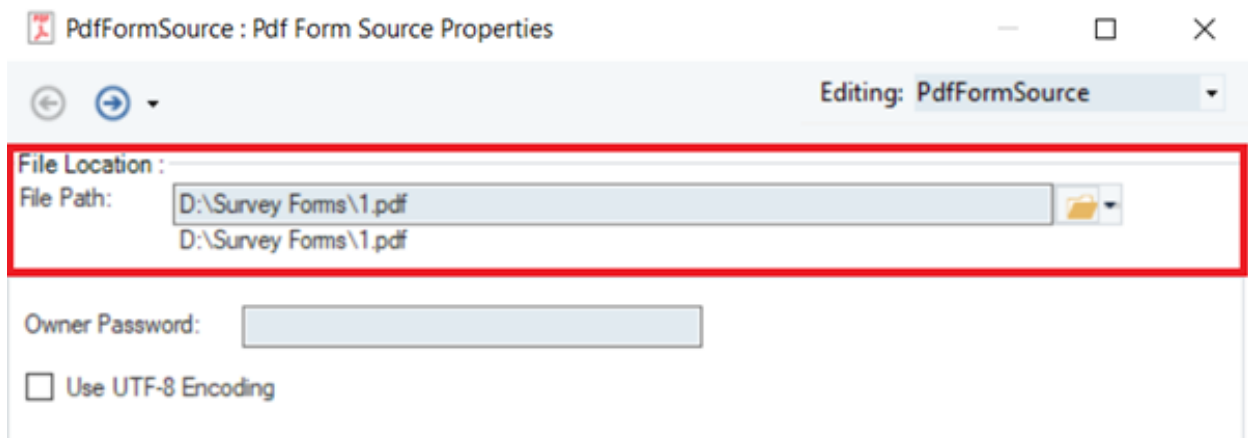

File System Items Source can be found in *Toolbox > Sources > File System Items Source*.

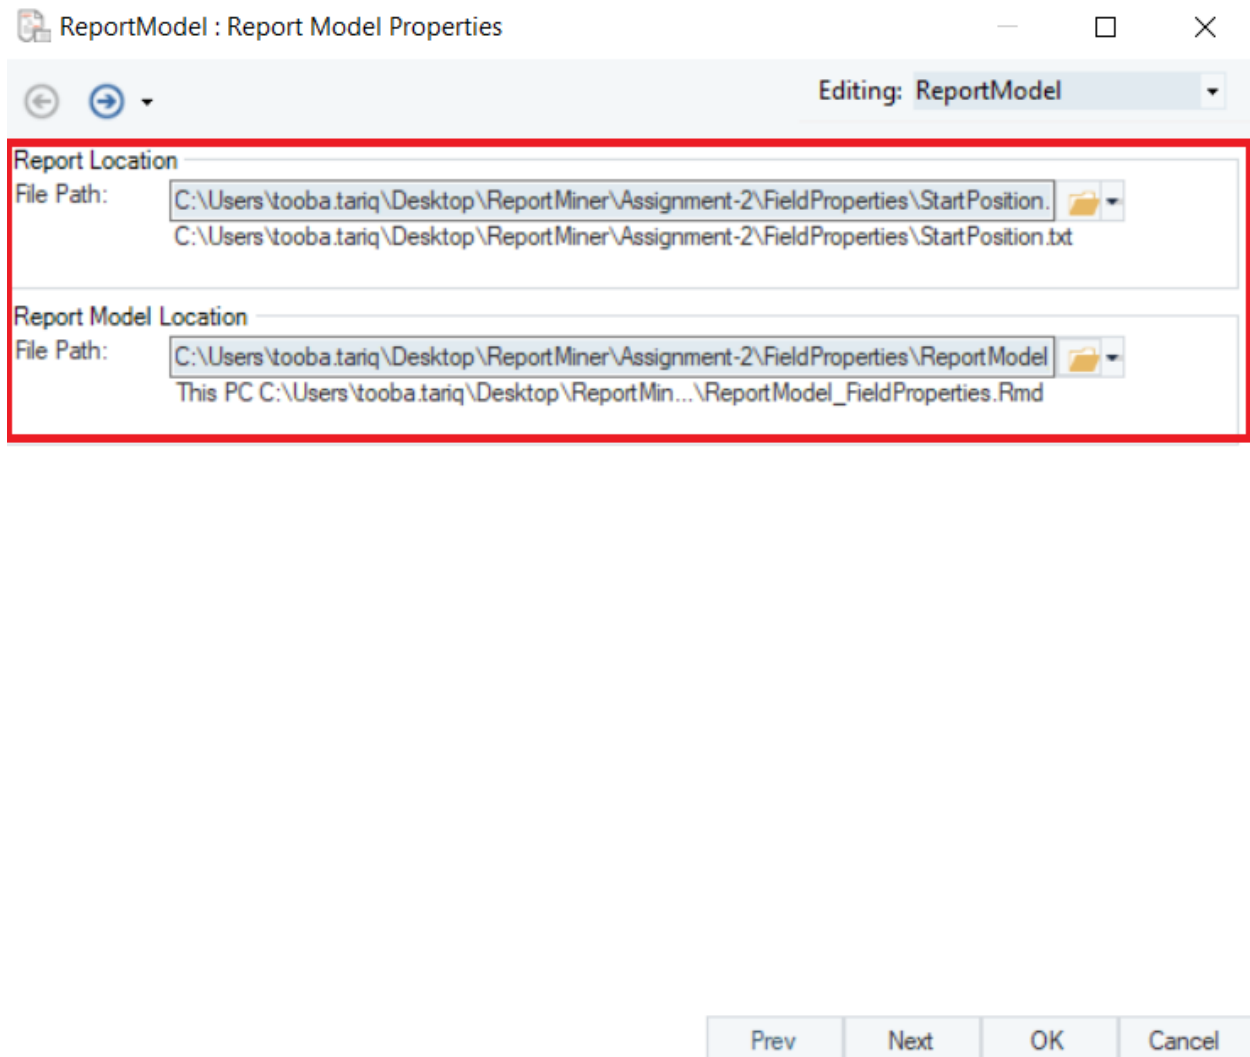

How does the PDF Form Source differ from Report Source in Centerprise?

The PDF form source in Centerprise is used to extract data from PDF files only, whereas the Report Source in Centerprise extracts data from unstructured files (including .txt and PDF files) using a report model.

With Pdf Form Source, you need to provide the file path in the properties to extract your data.

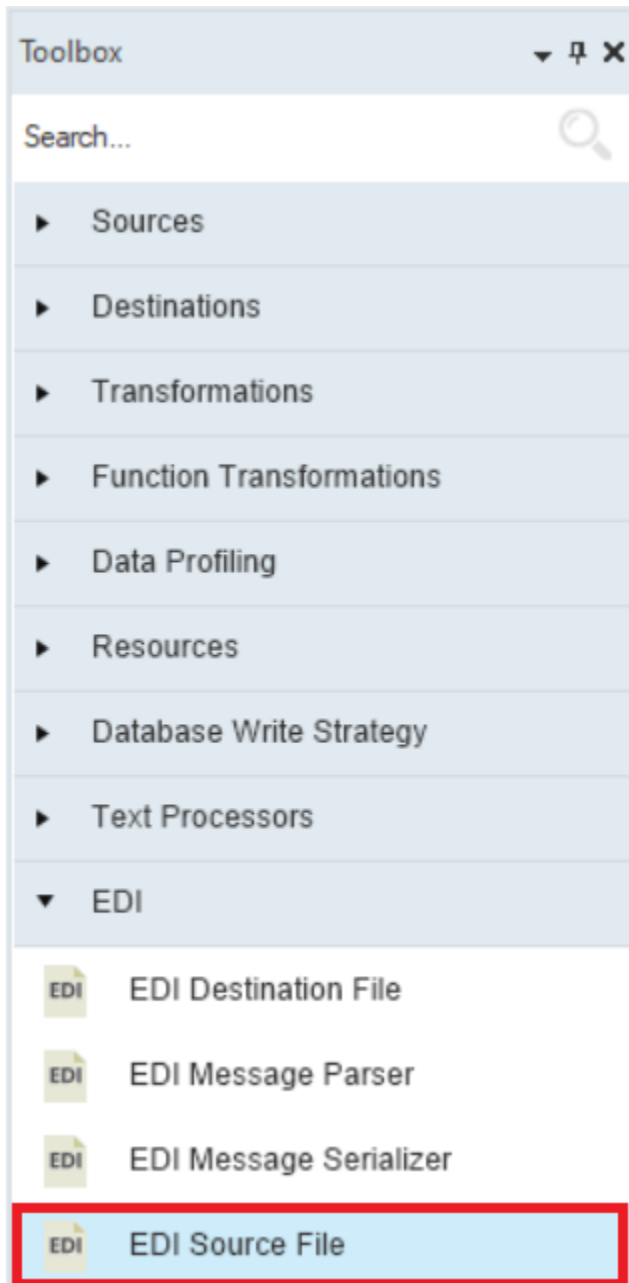

However, with [Report Source](#), first you point the path to a source file and then to a corresponding report model which will serve as an extraction template.

Does Centerprise support extraction of data from EDI files?

Yes, Centerprise supports the extraction as well as integration of data from EDI files. There's a dedicated section for EDI data integration in the toolbox that includes features such as EDI Source File, EDI Destination File, EDI Message Parser, and EDI Serializer. To use these features in a dataflow, go to *Toolbox > EDI*.****

How does the Raw Text Filter option work in file sources in Centerprise?

The Raw Text Filter option is available in the *Fixed Length File Source* and *Delimited File Source* properties.

DelimitedSource : Source Delimited File

Record Delimiter: <CR><LF>

Encoding: Unicode (UTF-8)

Text Qualifier: ☐ This is a Hierarchical File

Null Text: ☐ Use Memory Mapped File

☐ Make all Fields as String in Build Layout

Dynamic Layout

☐ Dynamic Layout

☒ Delete Fields In Subsequent Objects

☒ Add Fields In Subsequent Objects

Advanced File Options

Header options (if your file contains header that spans over multiple rows, specify the number of rows here)

Header spans over: 1 rows

☐ Enforce exact header match

☐ Column order in file may be different from the layout (Uses layout column headers to identify columns)

☒ Column headers in file may be different from the layout (Uses layout column order to identify column)

☐ Use SmartMatch with Synonym Dictionary

Use this option to skip any unwanted rows at the beginning of your file

Skip initial: 0 records

Raw text filter (Use this feature to filter out records that you do not want to process. Also useful for processing files containing multiple record types)

☒ No filter. Process all records

☐ Process if begins with:

☐ Process if matches this regular expression:

String Processing

☒ Treat empty string as null value.

☒ Trim strings

Raw text filter is used to filter out the incoming records which you do not want to process in your dataflow. This option is also useful in processing files that contain multiple record types. It also provides the flexibility to source selected data by applying filters at the point of extraction, without modifying the original source data in any way. You can choose from the following three options to filter data:

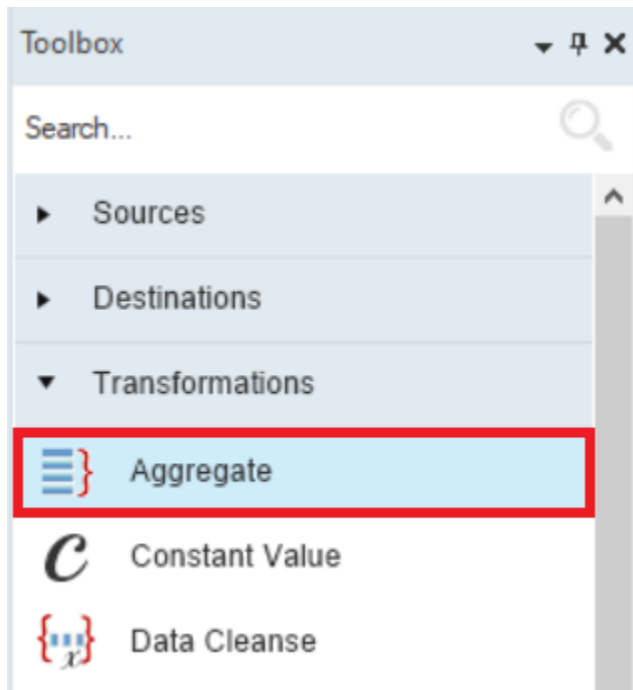

No filter. Process all records: This is the default option and it processes all the records from the source without filtering them out.

Process if begins with: This option filters out records that start with a certain letter, digit, character, word, numeric value or phrase.

Process if matches the regular expression: This option is useful if you want to use a regular expression to extract matching records.

What does the Aggregate Transformation do in Astera Centerprise?

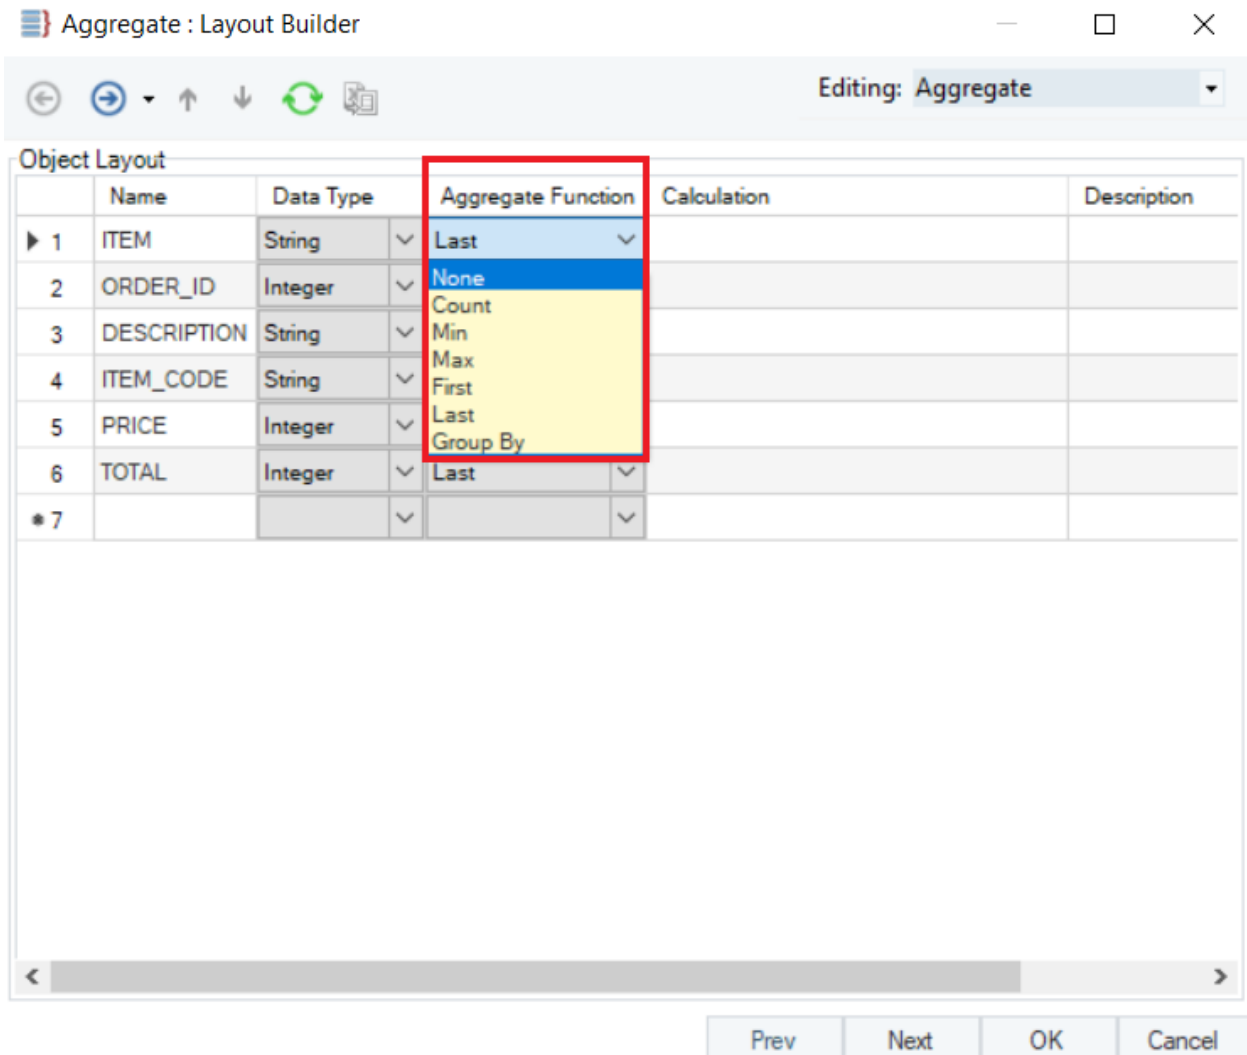

The [Aggregate Transformation](#) in Astera Centerprise provides the functionality to derive aggregate values from your input data by applying aggregate functions such as Group By, Sum, Count, First, Last, Min, Max, Average, Var or StDev. The dataset can be split into two groups so that aggregate value(s) can be generated for the group instead of the whole dataset. For example, calculate the number of employees by city, or get average sales price by year. To use the Aggregate Transformation in a dataflow, go to *Toolbox > Transformations > Aggregate*.

How is the Aggregate Transformation different from the Expression Transformation?

Added again.

In the [Aggregate Transformation](#), you can apply different aggregate functions such as Sum, Count, First, Last, Min, Max, Average, Var or StDev and derive values from the input.

Whereas in [Expression transformation](#), you can apply various functions such as string, date/time, financial, matching, logical, mathematical, regular expressions etc. on your incoming data or even write your own expressions in the expression layout builder.

What are the different sorting options in the Aggregate Transformation and how do they impact the output?

There are three sorting options found in the *Aggregate* Transformation properties:

- **Incoming data is presorted on group by fields:** In this option, aggregate transformation requires the incoming data to be pre-arranged on the basis of “Group-by” field.
- **Sort Incoming data before building aggregate:** When this option is selected, the incoming data will be sorted before applying the aggregate functions.
- **Build aggregate using unsorted data:** This option builds aggregate using the incoming data which may or may not be sorted.

Aggregate : Aggregate Transformation Properties

Editing: Aggregate

☐ Incoming data is presorted on group by fields

☐ Sort incoming data before building aggregate

☒ Build aggregate using unsorted data
(May require considerable memory depending on the size of dataset)

☐ Case sensitive

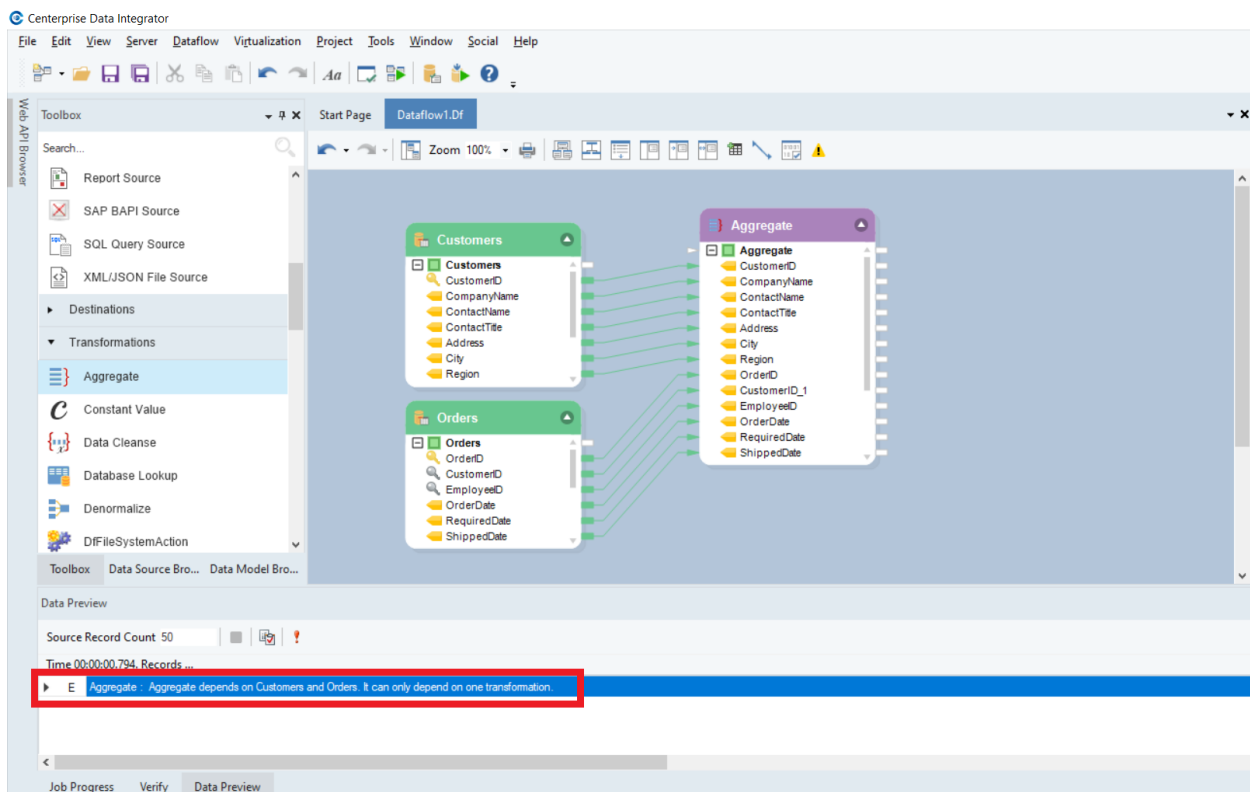

Prev Next OK Cancel

Can we omit duplicate records using the Aggregate Transformation in Astera Centerprise?

No, but Astera Centerprise has a dedicated [Distinct Transformation](#) to filter out duplicate records from a dataset.

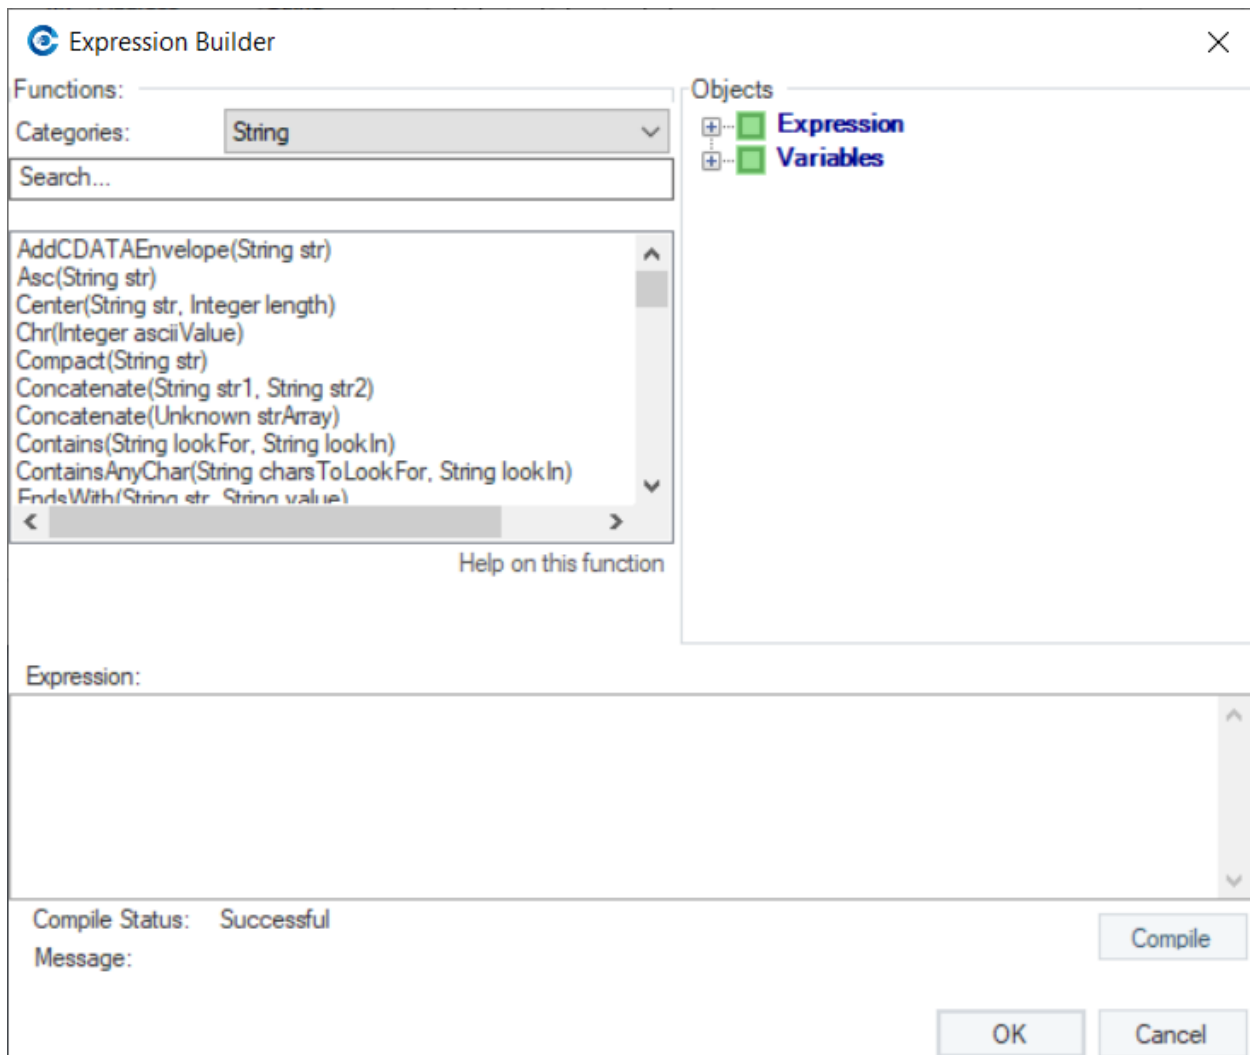

How many datasets can a single Aggregate object take input from?

The **Aggregate transformation** is a set-level transformation which means that it can only take input from a single dataset. It creates derived values from input data. So, taking input from more than one source will result in **cardinality error**.

What is an Expression Transformation?

An **Expression Transformation** object defines an expression or logic to process an incoming value or a set of values. Some expressions do not depend on any user-provided input data, such as *Now()* which returns current date and time. All expressions return an output value of a corresponding data type.

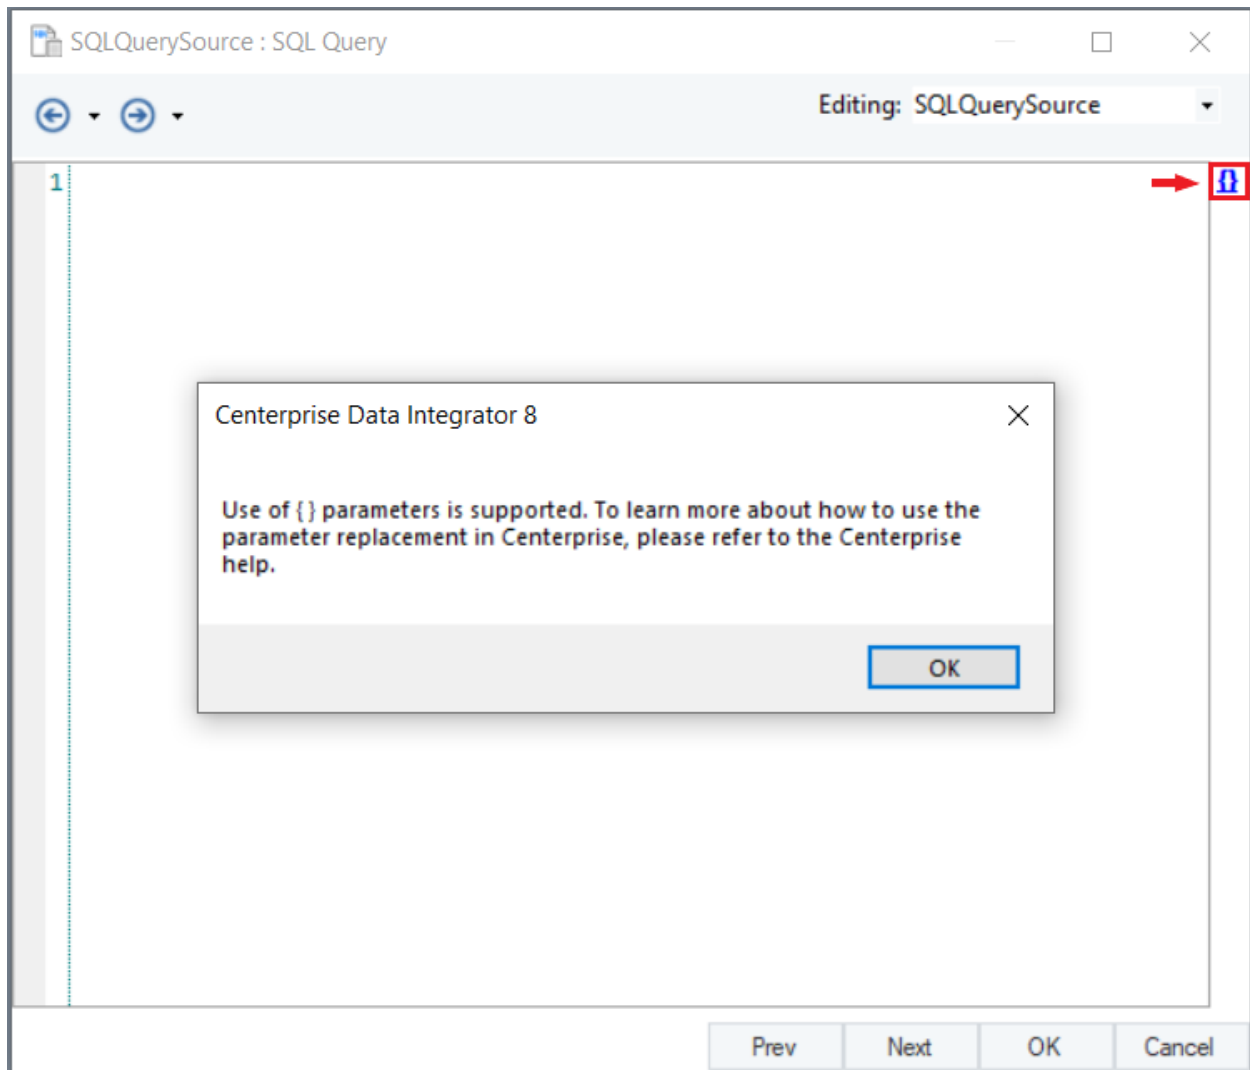

How is Expression Transformation different from the Function Transformation?

In the *Expression* transformation, you can define an expression either from the library of built-in functions in the expression builder or write your own expression. You can also modify and use variables for various calculations in the expression transformation. Whereas in the *Function* transformation, you can only work with a set of built-in functions. You cannot modify or customize these built-in functions to suit your requirement, as you can do in the Expression transformation.

Does the SQL Query source support the use of parameters? If yes, how and in what cases can it be used?

Yes, the SQL Query source in Astera Centerprise supports the use of parameters. These parameters can be specified using a '\$' notation in Centerprise 7.6 and with '{}' in Centerprise 8. A flow created in 7 with '\$' parameters will work in Centerprise 8 but once you save it in 8, the parameter syntax will change to '{}'.

What is a set level transformation?

Set level transformation operates on a group of records that may result in joining, rearranging, elimination, or aggregation of records. Data sources and destinations are also considered as set transformations. Generally, set transformations operate on the entire data set. For instance, a Sort transformation sorts the entire dataset before passing records to the next object. Similarly, Aggregate transformation uses the entire data set to construct aggregated records.

Some more examples of Set level transformations in Astera Centerprise include: [Join](#), [Route Constant Value](#), [Distinct](#), [Denormalize](#), [Normalize](#), [Merge](#) etc.

What is a Record level transformation?

Record level transformations are used to transform or augment individual fields of datasets during their movements between set transformations. They are used to create derived values by applying a lookup, function, or expression to the individual data fields.

Example of record level transformations include [List lookup](#), [File lookup](#), [Expression](#), [Sequence Generator](#), [Switch](#) etc.

What are the different types of lookups in Astera Centerprise?

There are four types of lookups in Astera Centerprise: List lookup, File Lookup, Database Lookup and SQL Statement Lookup.

The **List lookup** is the type of lookup that stores information in the metadata which means that the lookup information is stored within the dataflow itself. You can define a list of source as well as lookup values in the lookup properties, which are then looked up and replaced when you run your dataflow.

The **File lookup** is used to lookup values from an Excel or Delimited file. It can be performed based on a single lookup field as well as a combination of fields. Similarly, a file lookup can return a single output field from a lookup table or a combination of fields. In either case, the output field or fields are returned from the records in which the lookup values match the incoming values.

The Database lookup is used to lookup values in a database table that contains lookup values as well as the output values.

The DB lookup can be performed on a single lookup field or a combination of fields. Similarly, it can return a single lookup field or a combination of them in the output. In either case, the output field or fields are returned from the records in which the lookup values match the incoming values.

The SQL Statement Lookup works just like a Database Lookup. However, unlike Database Lookup in which we use a database table to look up matching values, we run an SQL query to fetch matching records from the lookup table. We can define one or more conditions by specifying the relationship between the database element and the input element which should be fulfilled by all the incoming records. Any record which does not pass the defined condition(s) would be discarded.

How is the Filter Transformation different from the Route Transformation?

The **Filter transformation** is used to filter out records that do not match a given condition. It does not keep any track of records that fail to satisfy a given rule. On the other hand, the **Route Transformation** invokes one or more paths in a dataflow, according to the specific decision logic(s) expressed as a set of rules. Using Route transformation, you can create a custom logic involving multiple paths and adapt it to suit your data processing scenario.

Is the Filter transformation similar to Data Quality Rules in function?

The Filter transformation is similar to Data Quality Rules. However, unlike Data Quality Rules, which returns an error or warning when a record fails to match a rule while still passing the record downstream, the Filter Transformation will completely filter out any such records. Moreover, the filtered records as well as their status will not be accessible to any downstream object in the dataflow, including any type of log.

What are the different types of Join available in Astera Centerprise?

There are four types of Join available in Astera Centerprise: Inner, Left Outer, Right Outer and Full Outer.

Inner – returns records that records that have matching values in both tables

Left Outer - returns all records from the left table, and the matched records from the right table

Right Outer - returns all records from the right table, and the matched records from the left table

Full Outer – same as Inner Join, but unmatched records from either record set are returned, and null values are written for the unmatched record in the other record set.

Can we perform a Join using more than one key in the Join transformation?

Yes, we can perform a join action using more than a one join key in the Join transformation. On the Join Transformation Properties screen, there is an option for *Left Field* and *Right Field* where you specify the key fields from both the incoming datasets based on which the Join action is to be performed.

What's the difference between INSERT, UPDATE, UPSERT and DELETE actions available for data loading in a Database Table destination?

Using the INSERT, UPDATE and UPSERT options, you can add individual mapping ports for respective actions, which means Centerprise will create one mapping port for each action inside the Database Table Destination object.

The INSERT option pushes the incoming records to the destination.

The UPDATE option keeps track of the records being updated in the database table.

The UPSERT option is the combination of 'Update' and 'Insert' which means that it will check for the records that are inserted or updated.

What does the Truncate Table option do in Database Table destinations?

The Truncate Table option is available when we are picking an existing table to write our data, in the Database Table Destination object. It first deletes the existing records in the selected database table and then loads the new, incoming records in that table.

What's the difference between '*Bulk insert with batch size*' and '*Use single record insert*' Data Load Options in Database Table destinations?

Both '*Bulk insert with batch size*' and '*Use single record insert*' options are used for inserting records in a database table. The '*Bulk insert with batch size*' option is used when you want the whole dataset to be loaded in batches of a specified size. Typically, larger batch sizes result in better transfer speeds. However, performance gains may be less with relatively large batch sizes. On the other hand, the '*Use single record insert*' option inserts one record at a time which is relatively slower. However, any errors or warnings during the transfer are identified immediately as they arise during the data transfer.

CHAPTER 46

How does the Default Value column in Database Table destination layout work?

The Default Value column in Database Table destination object can be used to assign a value to replace null values in the incoming data. It can also be used to append a constant value to your output data by creating a new field in the layout builder just like a [Constant Value](#) object does.

What does the Advanced Connection Info option do in a Database object?

The *Advanced Connection Info* option is used to either override an existing connection settings or to set up a new connection. For instance, to avoid connection or command timeout for heavy queries, you can override the connection/command timeout from the Advanced Connection Info. Likewise, when you want to provide SSL connection to some SSL supported provider, you can specify this in the text box on this screen.

CHAPTER 48

What's the maximum number of groups we can create in Route transformation?

In v8.2 of Centerprise, there is no restriction to the number of groups you can create in Route Transformation.

What is the outcome if an incoming record matches multiple rules in Route transformation?

In *Route* transformation, there is an option to *Follow only first matched rule* in the *Properties* screen, as shown below.

Route : Route Transformation Properties

Editing: Route

☒ Follow only first matched rule

Rule Name	Expression	Active
RegionNull	IsNull(Region)	<input checked="" type="checkbox"/>
HomePageNull	IsNull(HomePage)	<input checked="" type="checkbox"/>

Rule Name: ☒ Active

When the following condition holds:

Prev Next OK Cancel

If the option is checked (it is checked by default), the record is assigned to the first rule it matches, even if it satisfies more than one rule. If the option is unchecked, the record follows all the rules it can satisfy.

To learn more about this, check out this video on [Routing Records to Follow Multiple Rules in Route Transformation in Astera Centreprise](#).

Can we perform a hierarchical join using the Join transformation in Centerprise?

No, we cannot. The Join transformation can only be used to join flat file formats. However, there is a dedicated transformation, the [Tree Join](#) transformation in Astera Centerprise which you can use to perform hierarchical joins in Astera Centerprise.

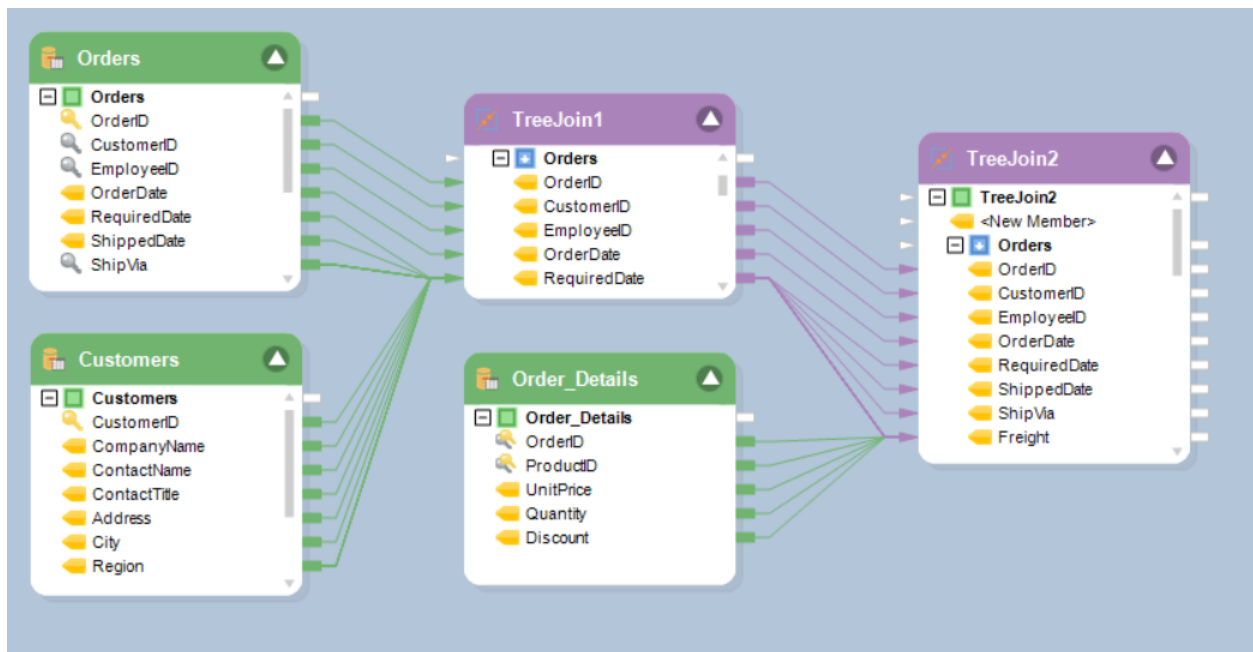

What is the meaning of Batch Size in Sequence Generator transformation where a sequence is generated in a Database Table?

The *Batch Size* determines the length of a sequence. If a dataset contains 300 records, and the *Batch Size* is set to 100, the sequence will repeat thrice since it will generate only 100 unique values and then repeat that sequence.

Can we join multiple children to a single parent node using only one Tree Join transformation object?

A *Tree Join* transformation object can only be used to join a parent node with a single child node. In order to join multiple children to a parent, multiple *Tree Join* objects can be used sequentially.

For example, here we have *Orders* as the parent, and we wish to join two children, *Customers* and *Order_Details*. We can do that by joining *Customers* and *Orders* in the first *Tree Join 1*, and *Order_Details* and *Orders* in the subsequent *Tree Join 2*.

Visit *Tree Join Transformation* to learn more.

Which output would be assigned if a record satisfies two conditions in a Switch transformation object?

It will assign the *Output* for the first matched *Case Value*.

What is the order of priority of options in different columns in the Layout Builder of the Merge transformation object?

The priority of options in *Merge* transformation is from left to right, the left-most option having the highest priority and vice versa. This means that the priority of options, from highest to lowest, is as follows:

1. *Survivor Type*
2. *Precedence*
3. *Condition*
4. *Expression*

What is the difference between Survivor Type and Precedence in Merge transformation?

Survivor Type determines which data entry should remain in a particular field, such as *First*, *Last*, *Maximum*, *Minimum*, *Count*, *Sum* or *Comma Separated Values*.

Whereas, *Precedence* decides the order of priority of the incoming data sources. For example, if there are three data sources and the *Precedence* = 1, 2, 3, it means the preference of the incoming data sources is in ascending order.

Why does the Return All option on the Lookup Options screen in the File Lookup transformation give an error?

The error is due to a mismatch in the cardinality of the two incoming data sources. When we select *Return All* in the *Lookup Options* screen, it returns multiple values to write in one field, leading to a one-to-many relationship. The change in cardinality returns an error.

To resolve this problem, flatten the data using some other transformation, such as *Join* or *Union*, before writing it to a destination.

If I want to have a different field delimiter, say a pipe (“|”), is there an option to export with another delimiter and filename extension?

Yes, in a *Delimited File Destination* object, you can either choose a *Field Delimiter* from the drop-down list or specify one according to your dataset.

Record_Export : Destination Delimited File

Editing: [v]

File Location

File Path: D:\Centerprise\Module3-Sources-Destinations\Exported_Data.csv

Options

☒ First Row Contains Header

Field Delimiter: | (Select an item from list or enter a field delimiter not in the list)

Record Delimiter: <CR><LF>

Encoding: Unicode (UTF-8)

Text Qualifier: " ☐ Apply Text Qualifier to All Fields

Null Text:

☐ Append to File (If Exists)

☐ Hierarchical Destination

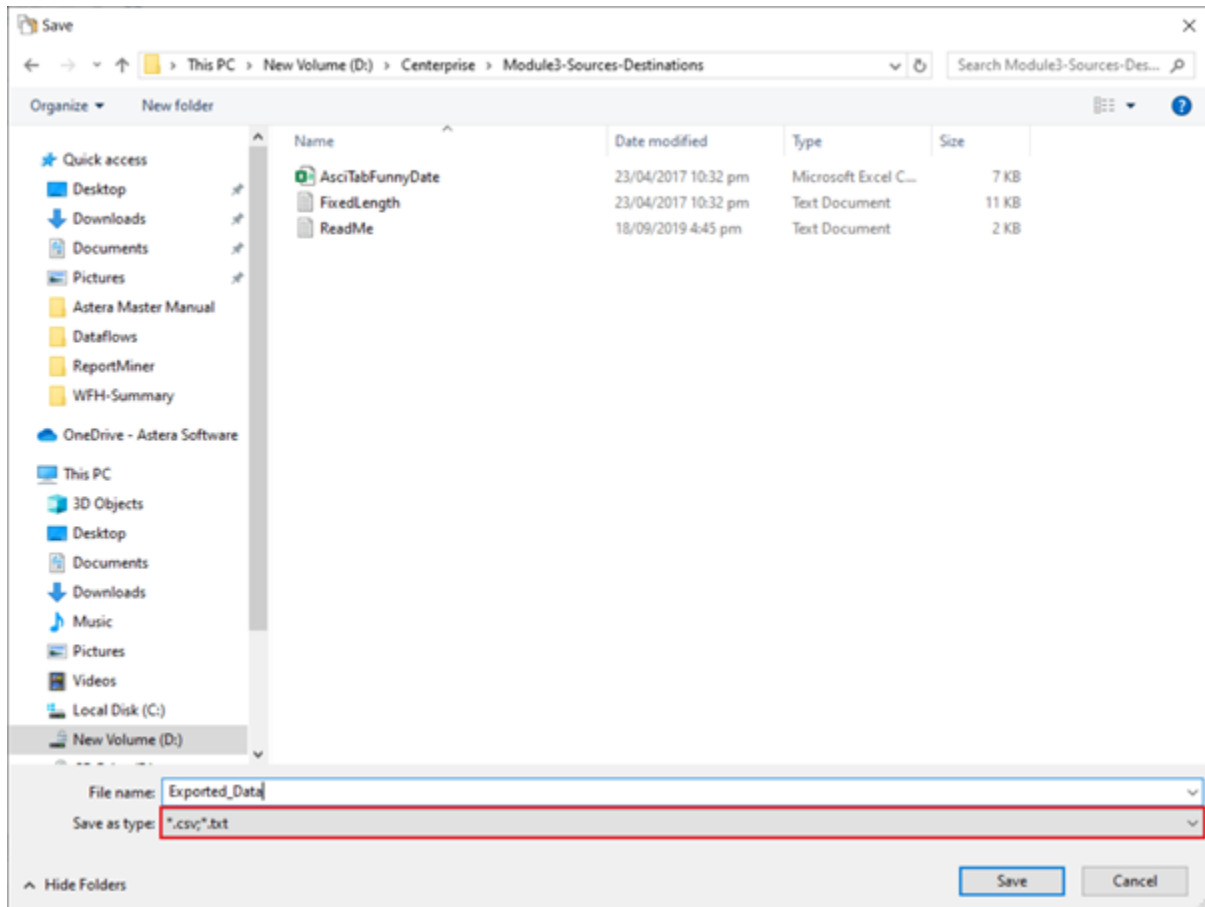

☐ Omit Byte Order Mark (only applies to certain UTF encodings)

☐ Write to Multiple Files

Rule for Filtering Data

Prev Next OK Cancel

Also, while exporting to a *Delimited File Destination*, you have the flexibility to choose whether you want to export it in .CSV format or .txt format.

I want to change the output format of a column, say integer to string, or vice versa. Any error trapping abilities with that conversion?

Yes, in Centerprise, you can change the data types of fields while exporting the data. Although you can convert the integer data type to string data type, vice versa is only possible if your string data type is convertible to an integer data type. Else, Centerprise will give an error and create a record level log of those erroneous records.

Record_Export : Layout Builder

Tools Menu > Data Format has different date formats, but it doesn't seem to do anything. Each time I go into it, it still has the first option selected even after choosing a different one.

This is because you can only add a new date format in *Tools > Data Formats*, but you cannot change any data field's date format. However, if you want to change the date format, you can do it while exporting your data by specifying the format you wish to apply to your date field.

Can we export the Object Path column present in the Data Preview window?

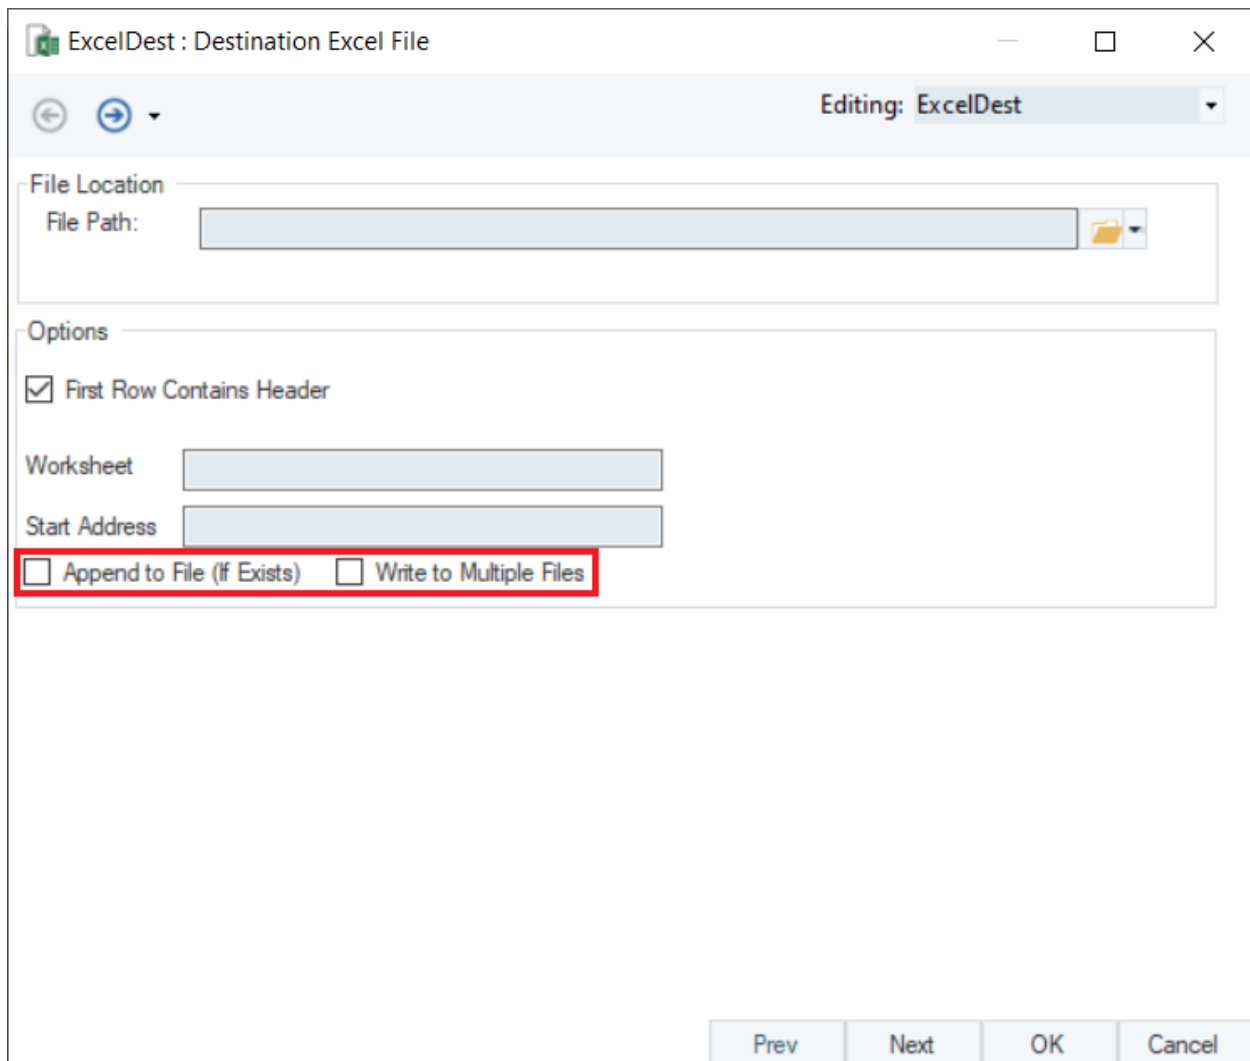

We cannot export the *Object Path* column to any destination. It only tells you the path from which the record is coming. If your output is in a hierarchical format, it will show the course of the entire hierarchy. For example, in the screenshot below, the data field ‘Title’ comes from the ‘EmployeesToBePaid’ object.

	Object Path	Object Path	Total Records	Records with errors	Records With Warnings				
▶	Document	Document	0	0	0				
	Object Path	Object Path	Total Records	Records with errors	Records With Warnings				
	EmployeesToBePaid	Document.Emplo	5	1	0				
	Object Path	Field Name	Data type	Null Count	Null %	Error Count	Error %	Warning Count	Warning %
	Elements	EmployeeID	Int64	0	0.00%	0	0.00%	0	0.00%
	Elements	Title	String	0	0.00%	0	0.00%	0	0.00%
	Elements	LoginID	String	0	0.00%	0	0.00%	0	0.00%
	Elements	MaritalStatus	String	0	0.00%	0	0.00%	0	0.00%
	Elements	Gender	String	0	0.00%	0	0.00%	0	0.00%
	Elements	HireDate	DateTime	0	0.00%	0	0.00%	0	0.00%
	Elements	SalariedFlag	Boolean	0	0.00%	1	20.00%	0	0.00%

CHAPTER 61

What will be the outcome if we write files multiple times to the same Excel Destination?

In the first run, it will always create a new file and write the data to that destination. In any subsequent runs, the user can choose how to write the file.

The image shows a dialog box titled "ExcelDest : Destination Excel File". It has a standard Windows window frame with minimize, maximize, and close buttons. Below the title bar, there are navigation arrows and a dropdown menu labeled "Editing: ExcelDest". The dialog is divided into two main sections: "File Location" and "Options".

File Location

File Path: [Text Field] [Folder Icon]

Options

☒ First Row Contains Header

Worksheet: [Text Field]

Start Address: [Text Field]

☐ Append to File (If Exists) ☐ Write to Multiple Files

At the bottom right, there are four buttons: "Prev", "Next", "OK", and "Cancel". The "Append to File (If Exists)" and "Write to Multiple Files" options are highlighted with a red rectangle.

If the *Append to File (If Exists)* option is checked, the file will be appended to the existing Excel file. If the option is left unchecked, the Excel file will be overwritten.

If the *Write to Multiple Files* option is checked, the data will be written at the dynamic file path provided by the user.

For more information, check out this video on [writing data to multiple files using a single destination object in Astera Centerprise](#).

Is there a log file created that we can have written/saved to a folder of our choice for troubleshooting purposes? Something that shows when it ran, how many records it loaded, how many failed, and why?

Yes, you can create a record level log to capture the status (Success, Error, Warning, or Skip) for each transferred record. You can have any number of record-level logs in the dataflow. Each record level log will capture the status of the records in the object that it is connected to. You can also export its data afterward for troubleshooting purposes.

Why Database Diff Processor does not have an output node in Centerprise v8.2?

In v8.2 of Astera Centerprise, the output node from *Database Diff Processor* has been removed to make it simpler to use. It enables users to configure the database table (with which the comparison has to be made) within the Diff object itself rather than using a separate destination object.

Which Database Write Strategy is more efficient for working with larger volumes of data?

It is not the amount of data that determines which write strategy would be more efficient to work with. Rather, it depends more on your requirement and what you want to achieve with your data. For example:

- If you want to work with dimensional data and preserve historical records, then *Slowly Changing Dimension* write strategy is the best option.
- If you want to determine which records have been updated, inserted, deleted, or skipped when you are writing to an existing file destination, the *Source Diff Processor* should be used in that case.
- If you want to find out which records should be inserted or updated in a database table, the *Database Diff Processor* would be the more efficient write option in that case.
- If you want to take write actions based on some specific conditions, then use *Data Driven Write Strategy*.

Note: In Astera Centerprise 9.0, the functionality of the *Slowly Changing Dimension* write strategy is fulfilled by the *Dimension Loader* object in the *Data Warehouse* section of the toolbox.

In which Database Write Strategy do we use a CDC file?

We use a CDC Hash file in the *Source Diff Processor*, whereas the *Database Diff Processor* relies on source CDC. However, the CDC file used in *Source Diff Processor* is different than usual. Instead of incrementing the records based on time, it captures a snapshot of the entire dataset and then compares whether the records have been inserted, updated, deleted, or skipped.

How can CDC improve the performance of Database Diff Processor when used in conjunction?

A CDC file acts as a filter that puts on a date stamp on the incoming records so that when the records are updated again, it sends only the updated or inserted records to the *Database Diff Processor*. In other words, it will only pass those records where the date is greater than that of records already stored in the CDC file. This way, the *Diff Processor* only needs to identify the inserted or updated records for synchronization. Thus, resulting in improved performance.

Which one from the Database Diff Processor and Source Diff Processor is a more cost-effective write strategy?

In *Database Diff Processor*, records are either inserted or updated based on the audit field, whereas full comparison is made in *Source Diff Processor*. So, if you have a database table destination, *Database Diff Processor* would be used, and in case of an Excel or Delimited destination, *Source Diff Processor* would be the only option.

Is it necessary for the database tables to be of same layout in order to work with Data Driven, Database Diff Processor, and Source Diff Processor?

The source and destination database tables do not need to be the same. Both the source and destination tables can be from two different databases. The names of the tables can be different as well. However, for *Data Driven* write strategy to work, the structure of the source and destination tables must be the same.

Is there any limitation to the type of source each Database Write Strategy can take input from?

No, there is no limitation to the type of source each Database Write Strategy can take input from. However, there is a limitation in the destination. All Database Write Strategies can only work with a Database Table destination, except the *Source Diff Processor*, which can be used for writing data into any file format such as excel, delimited, fixed-length, etc.

Why is it necessary to select the Single Port option in the Database Table Destination while working with a write strategy?

While working with a Database Write Strategy, it is necessary to select the *Single Port* option to tell the *Database Table* destination that it must follow the directive from the preceding write strategy.

Will a record be tried against the following rule if it satisfies the current rule in Data Driven write strategy?

No. In *Data Driven* write strategy, if a record passes a particular rule, it will not be tried against the following rule. Similarly, if a record does not pass one rule, it would be tried against the following rule and so on; until all rules have been exhausted.

What is the difference between ‘Single Output’ and ‘One Port for Each Action’ in Source Diff Processor?

In the *Source Diff Processor*, if you select the *Single Port option*, the database action, such as INSERT, UPDATE, SKIP, or ERROR, will be chosen by the Database Write Strategy’s logic rather than specified by the user. Whereas, if you select *One Port for Each Action*, you will get a separated node for each Diff action (INSERT, UPDATE, SKIP, or ERROR).

What is the difference between UPSERT and Database Diff Processor?

There is no functional difference between the UPSERT option in a *Database Table Destination* and the *Database Diff Processor* write strategy. We have retained the *Database Diff Processor* to ensure backward compatibility for users who have been using it.

Is it sufficient to use a Slowly Changing Dimension Write Strategy to insert new records and update existing records? Or do we need to use it in conjunction with Database Diff Processor for the purpose?

Slowly Changing Dimension is not Centerprise specific and would work the way it generally does in dimension modeling. Using the *Slowly Changing Dimension* strategy along would suffice to update or insert records in a destination table. You can specify the relevant SCD Type against the fields you want to insert or update in Centerprise.

Note: In Astera Centerprise 9.0, the functionality of the *Slowly Changing Dimension* write strategy is fulfilled by the *Dimension Loader* object in the *Data Warehouse* section of the toolbox.

How can Source Diff Processor load data incrementally?

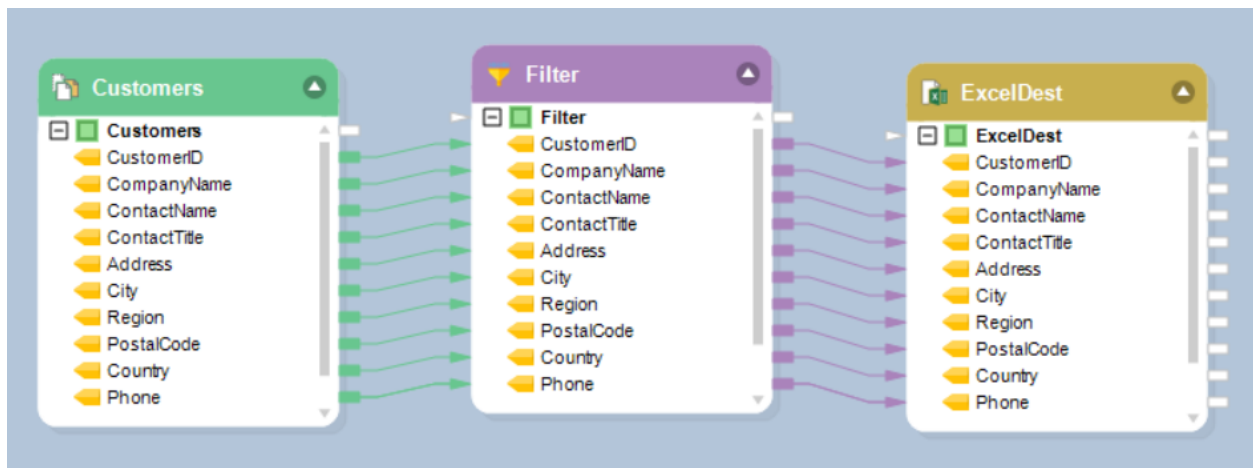

The *Source Diff Processor* works differently from the traditional incremental approach. It captures an image of the entire data. When records are updated again, it first compares them with the existing image stored in the CDC Hash file and then loads them into the destination table.

CHAPTER 76

What is a dataflow?

A dataflow is an XML document that defines the flow of data from the point of extraction all the way to the destination, based on some predefined logic.

This is an example of a simple dataflow in which data extracted from an *Excel* source is being transformed (*Sorted*) and then loaded to a delimited file destination (*DelimitedDest*).

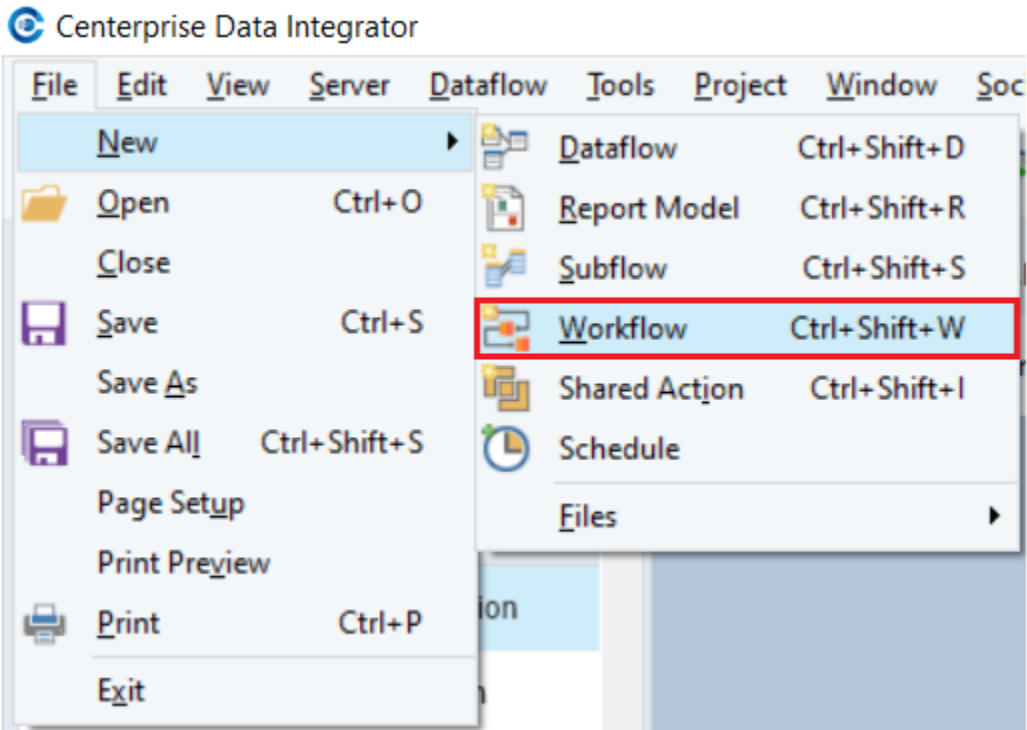

What is a workflow?

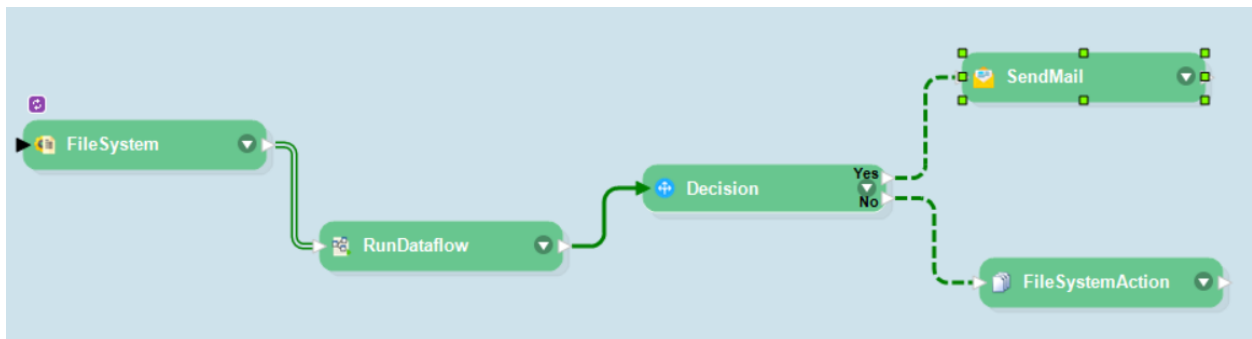

A workflow is the visual illustration of an integration process for automated and iterative execution. It is a process orchestrated to run a sequence of tasks such as running a program, sending an e-mail, executing some SQL query, etc. The tasks are executed according to a pre-defined sequence, following a custom logic which decides what path must be activated under what conditions.

You can also specify what should happen at each step if a task runs successfully or returns an error in a workflow. You can also route the workflow by using a Boolean condition suitable to your scenario. You can even nest another workflow or a dataflow within your workflow.

Once designed, a workflow can be deployed on the server and scheduled to run automatically as per the specified time and frequency. To open a workflow in Centerprise, go to the menu bar at the top and select *File > New > Workflow*.

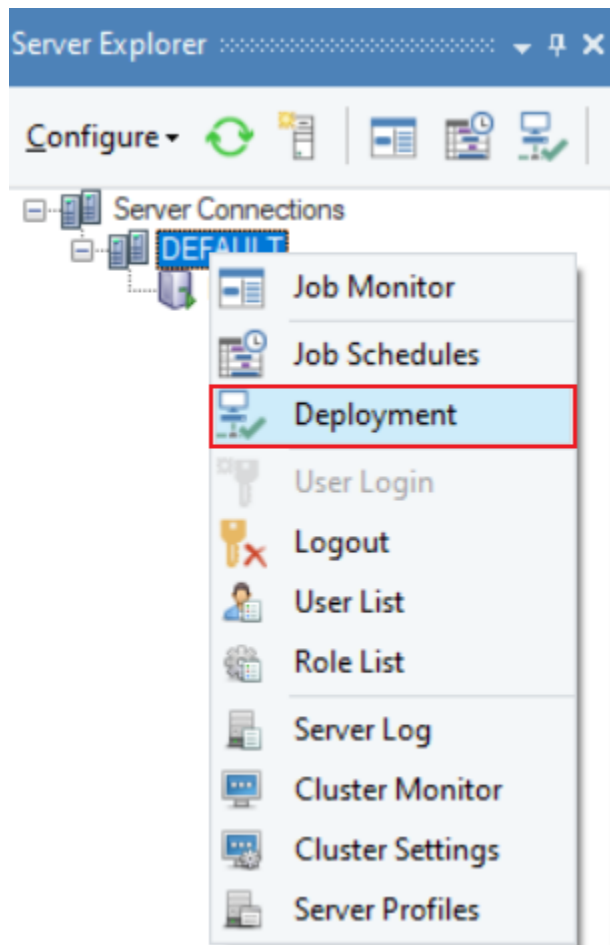

Or you can open a workflow directly by clicking on the create new dataflow's dropdown in the *Icon Bar*.

Click [here](#) to read more on creating and using workflows in Astera Centerprise.

What does deployment refer to in Centerprise?

Setting up a Centerprise project to run on scheduler is called *deployment* in Centerprise. A deployment is made up of a project .car file with an optional config file for parameters. To know more about how Project Deployment works in Astera Centerprise, read [here](#).

What is the difference between a Decision and OR object in workflows?

If a *Decision* object is connected to two *Run Dataflow* task objects, it will work like an AND operator, which means it will wait for both to complete their execution and then allow the workflow to proceed further. Whereas in the same scenario, an *OR* object will enable the workflow to proceed further even if one of the dataflows is executed successfully. In other words, it works like an OR logic gate in discrete mathematics.

Is it possible to work with nested subflows in Astera Centerprise?

Yes. A subflow can be nested, meaning that you can call a *Subflow* transformation object in another subflow.

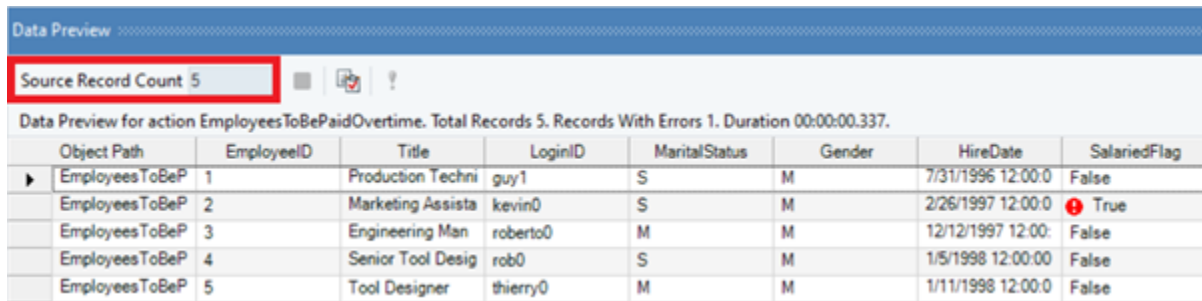

What is the difference between Single Instance Data Region and Collection Data Region in Astera ReportMiner?

A *Single Instance Data Region* is used when the relationship between two regions is a one-to-one relationship. For example, in a dataset of orders, an order can only be placed by one customer. Therefore, we will use *Single Instance Data Region* to extract details of the customer from the data source.

A *Collection Data Region* is used when the relationship between two regions is a one-to-many relationship. For example, in a dataset of orders, there can be multiple items in one order. Therefore, we will use *Collection Data Region* to extract details of the items ordered.

How can we preview 'x' number of records in a Data Preview window?

You can preview 'x' records by specifying the number in the *Source Record Count* option present in the Data Preview window. If you want to preview the entire dataset, set the *Source Record Count* value to zero.

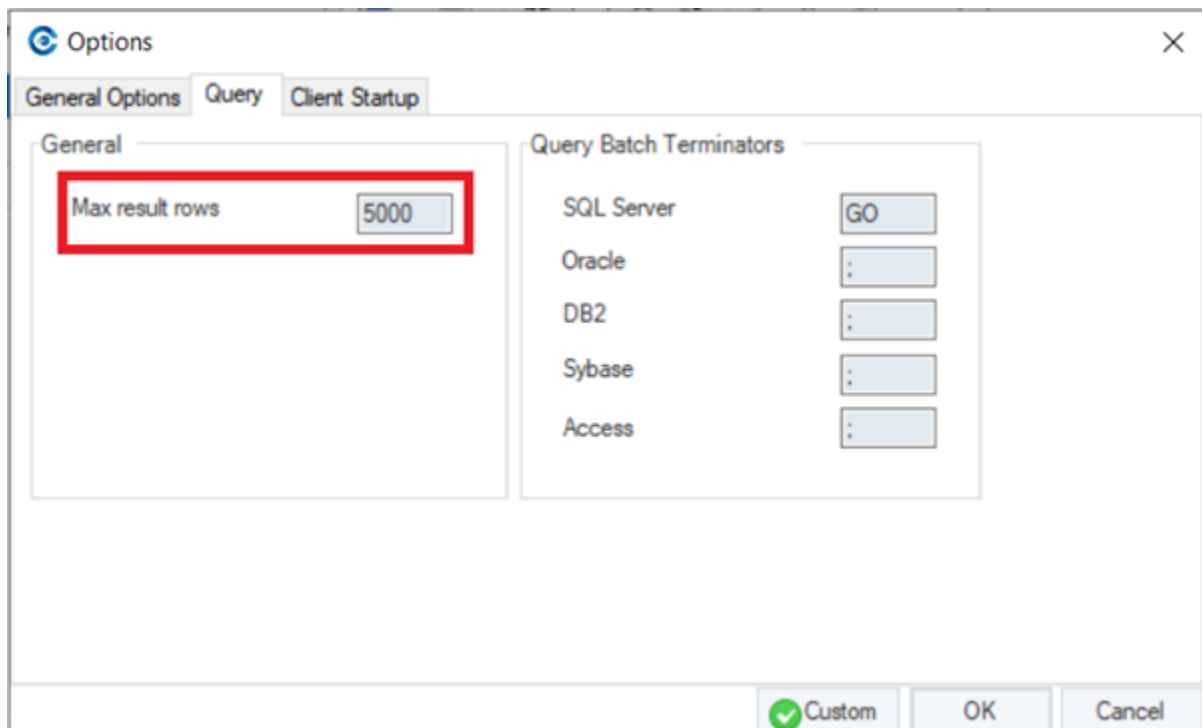

The screenshot shows the 'Data Preview' window. At the top, there is a blue header bar with the text 'Data Preview'. Below the header, there is a light blue bar containing the text 'Source Record Count: 5', which is highlighted with a red rectangle. To the right of this text are three small icons: a square, a magnifying glass, and a question mark. Below this bar, there is a line of text: 'Data Preview for action EmployeesToBePaidOvertime. Total Records 5. Records With Errors 1. Duration 00:00:00.337.' Below this text is a table with 8 columns: 'Object Path', 'EmployeeID', 'Title', 'LoginID', 'MaritalStatus', 'Gender', 'HireDate', and 'SalariedFlag'. The table contains 5 rows of data, all with 'EmployeesToBeP' in the 'Object Path' column. The 'SalariedFlag' column shows 'False' for most rows, but 'True' for the second row, which is marked with a red error icon.

Object Path	EmployeeID	Title	LoginID	MaritalStatus	Gender	HireDate	SalariedFlag
EmployeesToBeP	1	Production Techni	guy1	S	M	7/31/1996 12:00:0	False
EmployeesToBeP	2	Marketing Assista	kevin0	S	M	2/26/1997 12:00:0	True
EmployeesToBeP	3	Engineering Man	roberto0	M	M	12/12/1997 12:00:	False
EmployeesToBeP	4	Senior Tool Desig	rob0	S	M	1/5/1998 12:00:00	False
EmployeesToBeP	5	Tool Designer	thierry0	M	M	1/11/1998 12:00:0	False

CHAPTER 83

Does the Max result rows option in *Tools > Options > Query tab* being defaulted at 5000 limit the processing of any records?

In the *Tools > Options > Query tab*, the *Max result rows* option does not limit the processing of any function on your dataset. It only limits the number of rows in the data preview to ensure higher efficiency of the preview on design time.

What is Pushdown Mode?

ETL (Extract, Transform, Load) and ELT (Extract, Load and Transform) are two approaches of data manipulation. In an ETL process, the data is transformed in the staging area that is usually placed in between the source and target systems. On the contrary, in an ELT process, the transformations take place within the target database.

In Pushdown Mode, the ELT approach is used. The Pushdown mode in Astera Centerprise enables the users to choose where data processing happens by pushing down the transformation logic to the source or target database when they reside on the same server. This eliminates the unnecessary movement of the data, reduces network latency by delivering agile results and improves the overall performance.

For more information, visit [Pushdown Optimization Mode in Astera Centerprise](#).
